

Case Study

Improving the online web experience for International Hockey Federation

FIH

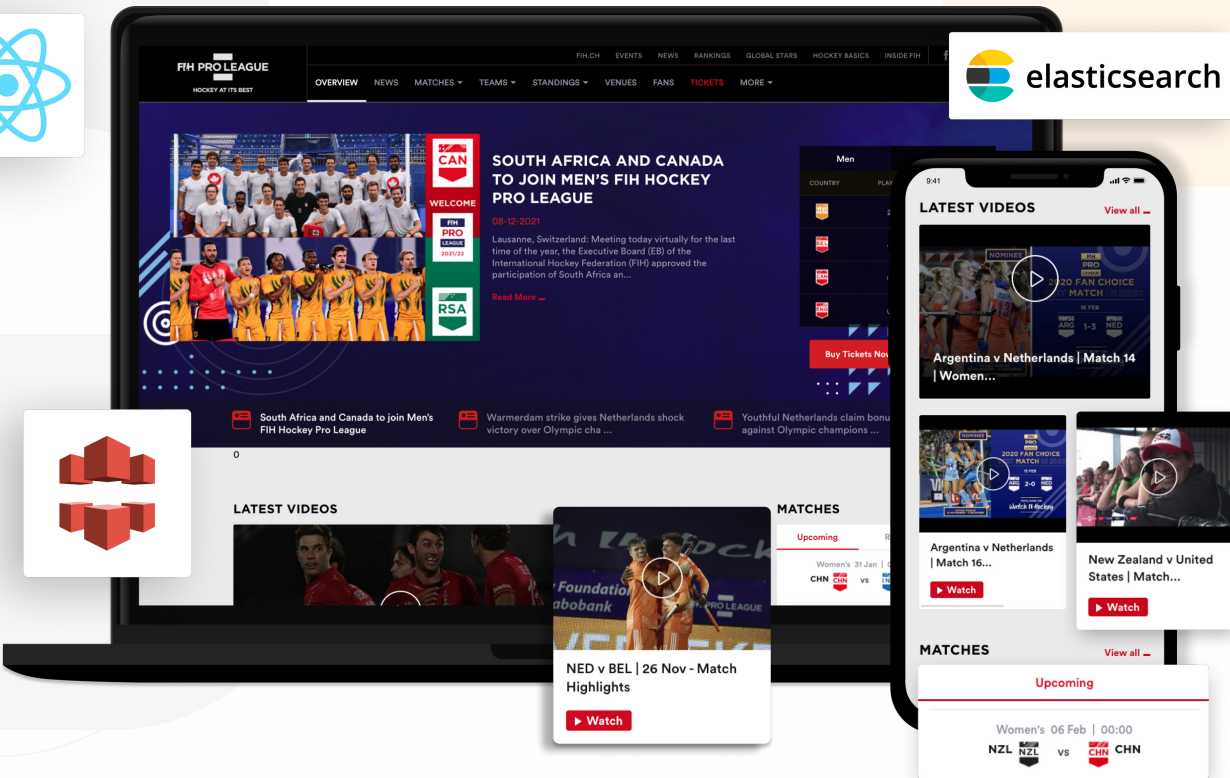

Hockey World Cup was the biggest event in the organization's history with over 3 million viewers in Asia alone. They wanted to launch a more powerful web presence before the event to be the digital companion of viewing experience.

Headless CMS

React.js

Redux SAGA

Selenium

Jmeter

ElasticCache

AWS S3

AWS CloudFront

Challenges

Deliver a fully tested, GDPR compliant website in 3 months before the World Cup event with scalable and flexible architecture such that platform can be reused with minimal changes for any upcoming FIH events.

Dynamic Front-end for high adaptability

Build system that easily supports different content types, widgets/components, dynamic content page creation with the ability to adopt changing requirements.

Handling traffic spikes with high performance

The FIH website is in the public domain and performance is a critical aspect given it will be visited by thousands of sports enthusiasts during the world cup.

Smarter content management & publishing

Reducing dependency on developers when it comes to maintaining the dynamic content and and improving application performance

Faster deployment to reduce time to market

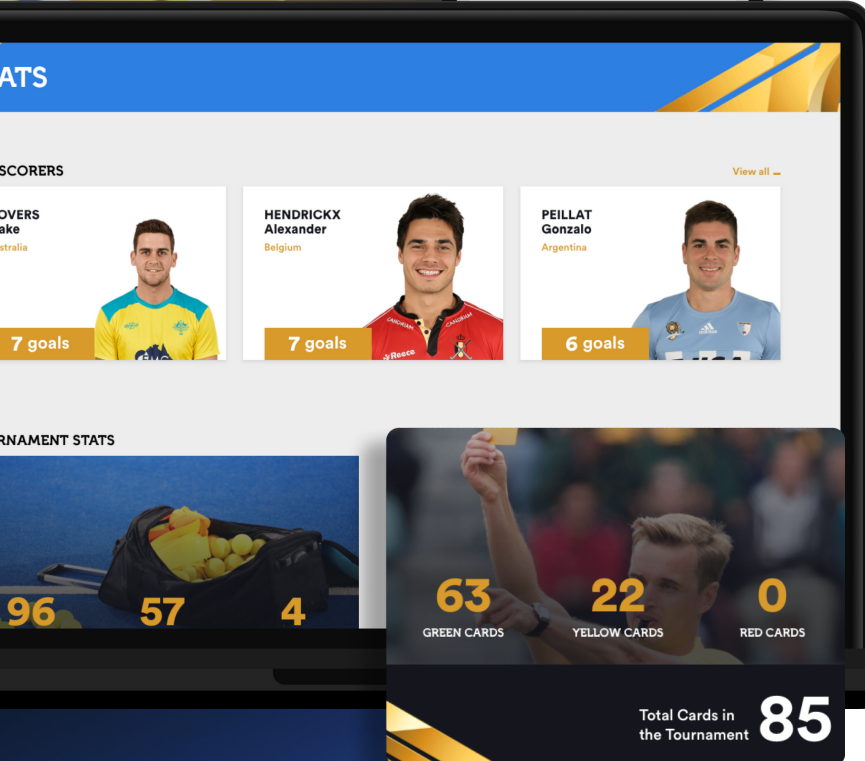

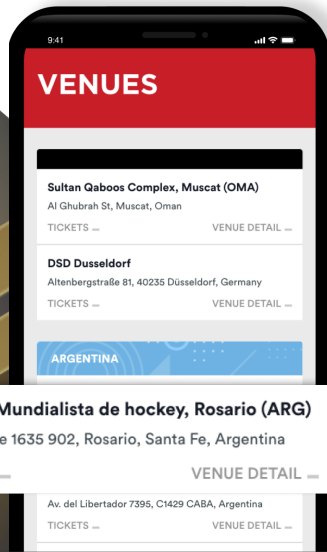

Reduce time to market and automate the deployment process with quality in check for all the updates to keep the website upto date

Our Solution

Headless CMS employed a **front-end agnostic architecture** which made it easier to build a scalable frontend architecture that FIH is using to create an entirely new platform for their upcoming events.

We built **reusable components library** in React using Storybook.js. which our team uses to build any upcoming FIH event website.

With headless CMS, Content authors gained more control on the look and feel of the content as UI/UX is decoupled from the CMS/Backend.

To have achieved the goal in such a condensed amount of time, with so many moving parts is a remarkable case study for anyone who is trying to pull something off like this.”

Our Solution

1 Modern Architecture to achieve superior performance

For better scalability and performance, we followed multiple approaches like **server-side rendering**, caching strategies, lazy loading to name a few.

2 Optimising content delivery approach through Cloud

Deployed solution on AWS EC2, used S3 to store all the media content and **Cloudfront to serve content** to 100,000 daily visitors around the world

3 DevOps engineering for improved quality delivery

Incorporated CI using Jenkins and automated **Infrastructure creation using AWS CloudFormation** or the delivery quality and process efficiency.

4 Automating performance testing cycle

We used JMeter WebDriver Sampler with Selenium to test client side performance automatically.

We are Simform

Simform is a leading digital product engineering company. Over the last decade, our world-class tech teams have refined engineering practices for Fortune 1000 companies and successful startups.

Let's get in touch to extend your tech team with top talent!
